#### Abstract

2-Aminothiazole has great biological and medicinal interest. Some of the marketed drugs also possessed this heterocyclic moiety. This manuscript reports the synthesis of a series of 2-Aminothiazole derivatives. The reaction between secondary amines, benzoyl isothiocyanate, and dialkyl acetylene dicarboxylates( = dialkyl but-2-ynedioates) in the presence of silica gel ( $\mathrm{SiO}_{2}$ ), led to alkyl 2-(dialkylamino)-4-phenylthiazole-5-carboxylates (6a-6l) in fairly high yields. All title compounds were characterized by IR, NMR and Mass spectroscopy. The antimicrobial activity of the compounds were evaluated against the following microorganisms: Staphylococcus epidermidis ATCC.14990, Bacillus subtilis ATCC.12711, Pseudomonas aeruginosa ATCC 27853Staphylococcus aureus ATCC 25923, Acinetobacter calcoaceticus ATCC 23055, and Escherichia coli ATCC 25922. The broth macrodilution method was used for determination of the minimum inhibitory concentration (MIC) during preliminary evaluation of antibacterial activity. The compounds yielded MIC values in the range of 7 to $3.9 \mu \mathrm{~g} / \mathrm{mL}$ for Staphylococcus aureus, 500 to $7 \mu \mathrm{~g} / \mathrm{mL}$ for Staphylococcus epidermidis, 62.5 to 0.097 , for Bacillus subtilis, 500 to $125 \mu \mathrm{~g} / \mathrm{mL}$, for Pseudomonas aeruginosa and 500 to 250forAcinetobactercalcoaceticus.The best MIC value with compounds $6 a-6 l$ was obtained for compounds $6 e, 6 f, 6 \mathrm{~g}$ and 6 hagainst Staphylococcus aureus and Bacillus subtilis.

Keywords: Antimicrobial activity; Minimum Inhibitory Concentration; Aminotiazol; antibacterial activity; In vitro

## INTRODUCTION

The organic moiety containing nitrogen and sulfur atoms are highly effective against various diseases[1,2].These compounds are effectively used for treatment of different kinds of fungal and bacterial infections as well as noninfectious diseases including gastric ulcer and cancer. Sulfur is forming both $\sigma$ and $\pi$ bonds, so research on their binding interactions with receptor [3]. Moieties have also been an interesting field of study during the past decade. Thiazoles are useful structural units in the field of medicinal chemistry and they have shown a wide variety of biological effectiveness [4]. The thiazole nucleus is present in the structure of many natural and biologically active substances, such as vitamin-B and some drugs like penicillins, cephalosporins [5], Abafungin, Famotidine, Meloxicam, Pramipexole, Riluzole, Sudoxicam, Sulfathiazole, Talipexole [6]. Several reports showed Thiazole containing $\mathrm{N}=\mathrm{C}=\mathrm{S}$ moiety's effectiveness as antibacterial, antifungal [7], anti-inflammatory [8], analgesic [9], ant tubercular[10], antipsychotics and antimalarial [11], as well as central nervous system (CNS) stimulant [12] anti-HIV [13] etc. Thiazide derivatives are introduced as useful clinical agents and some of its derivatives are inhibitors of herpes simplex viruses [14]. Herein, we report a hitherto, three-component reaction, green synthesis which, starting from readily available benzoyl isothiocyanate, secondary amines, and acetylenedicarboxylates, afforded the alkyl 2-(dialkylamino)-4-phenylthiazole-5-carboxylates (6a-61). All the synthesized compounds were screened for their antibacterial activities against some selected bacteria with determining their Minimum inhibitory and bactericidal concentration values.

## EXPERIMENTAL SECTION

## Synthesis of compound

Starting materials and solvents were obtained from Merck (Germany) and Fluka (Switzerland) and were used without further purification. Flash chromatography ( FC ): preparation of columns with Merck silica gel $\left(\mathrm{SiO}_{2}\right)$ powder. MP: Electrothermal-9100 apparatus; uncorrected. IR Spectra: Shimadzu-IR-460 spectrometer; $\delta$ in $\mathrm{cm}^{-1}$.
${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR Spectra: Bruker-DRX-300-Avancespectrometer; at $300.13\left({ }^{1} \mathrm{H}\right)$ and $75.467 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$; in $\mathrm{CDCl}_{3}$; $\delta$ in ppm rel. to $\mathrm{Me}_{4} \mathrm{Si}$ as internal standard, $J$ in Hz . MS: Finnigan-MAT-8430 mass spectrometer; ionization potential 20 eves. Elemental analyses: Heroes-CHN-O-Rapid analyzer.

Compounds 6a-61: General Procedure. To a stirred soln. of benzoyl isothiocyanate 1 ( 1 moll ) and secondary amine 2 $(1 \mathrm{moll})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{ml})$ was added drop wise a mixture of daily but-2-ynedioate $4(1 \mathrm{moll})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 3 ml ) at r.t. over 2 min . Then, after $0.5 \mathrm{~h}, \mathrm{SiO}_{2}$ powder ( 2 g ) was added and the solvent was evaporated. The dry materials were heated for 1 h at $90^{\circ} \mathrm{Cand}$ then placed on top of a column of $\mathrm{SiO}_{2}(10 \mathrm{~g})$. The column was washed with Accost/light petroleum ether 2: 10. The solvent was then evaporated: product 8 . The structures of products 6 were confirmed by their IR and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}$-NMR [15].

## Bacterial material

The antimicrobial activity was investigated by tube-dilution method by using the Clinical and Laboratory Standards Institute (CLSI) guidelines. This method is based on the inhibitory effect of a uniform solution of antibiotic in a broth culture on a bacterium with defined numbers. In this method minimal inhibitory concentration (MIC) as well as minimal bactericidal concentration (MBC) of the antimicrobial agent was determined. The MIC is the lowest concentration of an antimicrobial agent that inhibits the growth of the test bacterium whereas MBC is the lowest concentration of an antimicrobial agent that kills the bacterium. Antibacterial activity of synthesized compounds were tested against several gram positive and gram negative bacteria including: Staphylococcus epidermis's ATCC.14990, Bacillus subtilisATCC.12711, Pseudomonas aeruginosa ATCC 27853Staphylococcus aureus ATCC 25923, Acinetobacter calcoaceticus ATCC 23055, and Escherichia coli ATCC 25922. The MICs and MBCs of the synthesized compounds were determined using sterile glass test tubes containing Muller-Hinton broth(Merck). The inoculum contained $1.5 \times 10^{-6}$ cells $/ \mathrm{ml}$ of each tested bacterium. The synthesized compounds were tested in respect of their antibacterial effects in the range of 0.078 to $2.5 \mu \mathrm{~g} / \mathrm{ml}$. compounds were prepared in DMSO and freshly diluted on the day of testing. A tube containing growth medium without any chemicals or antibiotics and Ceftizoxime (in the range of $100-0.975 \mathrm{mg} / \mathrm{ml}$ ) were used as positive and negative growth controls respectively. Experiments were performed at least three times and the moral values were selected.

## RESULTS AND DISCUSSION

The title compounds were prepared within a one-step synthesis which consists in the reaction of $N$-benzoylthiourea derivatives (3), which were derived from the addition of secondary amines (2) to benzoyl isothiocyanate (1), with acetylene dicarboxylates (=but-2-ynedioates) (4) proceeded in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature to give compound (5). $\mathrm{SiO}_{2}$ Powder was found to catalyze the conversion of (5) to the alkyl 2-(dialkylamino)-4phenylthiazole-5carboxylates (6) under solvent-free conditions at $90^{\circ} \mathrm{C}$ in fairly good yields without the formation of by-products (Figure1).

Spectra: The mass spectra of these compounds displayed molecular-ion peaks at the appropriate $\mathrm{m} / \mathrm{z}$ values. The ${ }^{1} \mathrm{H}$ NMR spectrum $\left(\mathrm{CDCl}_{3}\right)$ of 6 i consisted of a doublet for the two $\mathrm{Me}_{2} \mathrm{CH}$ groups ( $\mathrm{p}_{\mathrm{h}} .1 .42,{ }^{3} J_{\mathrm{H}, \mathrm{H}}=6.9 \mathrm{~Hz}$ ), a singlet for the Meow group ( $\mathrm{p}_{\mathrm{h}} 3.74$ ), a multiplayer for the two $\mathrm{Me}_{2} \mathrm{CH}$ groups ( $\mathrm{p}_{\mathrm{h}} .3 .92-3.96$ ), and two multiplayer for the aromatic H-atoms ( $\mathrm{p}_{\mathrm{h}} .7 .39-7.42$ and $7.81-7.84$ ). The ${ }^{1} \mathrm{H}$-decoupled ${ }^{13} \mathrm{C}$-NMR spectrum of 6 i showed 11 distinct resonances; a partial assignment of these resonances is given in the Exper Part. The ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectra of compounds $6 \mathrm{a}-61$ were similar to those of 6 i , except for the resonances of the $\mathrm{R}, \mathrm{R}$, Rgroups (Table 1) which exhibited characteristic signals with appropriate chemical shifts (Table 1).

## Biological results

The antibacterial effects of compounds were compared with ceftizoxime as a reference. As can be deduced from tables, most of the synthesized compounds exhibited noticeable antibacterial activity against gram-positive bacteria including Staphylococcus epidermidise, Bacillus subtilis and Staphylococcus aureus. The results depicted in tables 1 and 2 revealed that compounds $6 \mathrm{e}, 6 \mathrm{f}, 6 \mathrm{~g}$ and 6 h showed comparable activity with ceftizoxime against tested Grampositive bacteria. Also compounds 6a and 6c displayed significant activity against Escherichia coli. The MICs and

MBCs of the synthesized compounds, against various selected Gram-positive and Gram-negative bacteria are shown in Tables 2 and 3 respectively.

The new 2-aminothiazol derivatives with piperidin and Bisphenylmethyl moiety exhibited a fairly broad spectrum antimicrobial activity against Gram-positive microorganisms. The aromatic compounds will improve the lipophilic nature of the compound at the same time methyl substituted compound would act as an electron donors. In addition the presence of an amine group at the 2 nd position of thiazole would be the essential element for hydrogen bonding with receptor.

## CONCLUSION

Some of the synthesized compounds exhibited promising antibacterial activity against gram positive bacteria comparable with Ceftizoxime. Furthermore the easy workup, high yield, and short reaction times makes the method a useful addition for preparing modern pharmaceutical synthetics.

## Acknowledgments

This work was supported by a grant from Urmia University of Medical Sciences. We would like to give a special thanks to those that have participated in this study.
